Using generative modelling to produce varied intonation for speech synthesis

Zack Hodari, Oliver Watts, Simon King

Our model can produce more varied intonation without sacrificing naturalness

Models

I. RNN and MDN are similar to standard SPSS-based TTS. VAE-PEAK should produce average prosody similar to RNN

VAE-TAIL should produce more varied intonation

speech samples

Overview

Normal speech synthesis voices produce average prosody

Most methods to alleviate this reduce the naturalness of the voice

Our method can produce multiple renditions of a sentence

We demonstrate that our model's output is significantly more varied but not at the expense of naturalness

VAE-PEAK	54.4%	45.6% RNN
MDN	54.8%	45.2% VAE — PEAK
VAE-TAIL	70.4%	29.6% MDN
COPY-SYNTH	64.6%	35.4% VAE-TAIL
RNN-SCALED	52.9%	47.1% COPY-SYNTH
MDN	59.4%	40.6% RNN
VAE-TAIL	74.4%	25.6% VAE-PEAK
COPY-SYNTH	80.2%	19.8% MDN
RNN-SCALED	66.2%	33.8% VAE-TAIL
VAE-TAIL	72.7%	27.3% RNN
COPY-SYNTH	83.1%	16.9% VAE - PEAK
RNN-SCALED	77.7%	22.3% MDN
COPY-SYNTH	84.4%	15.6% RNN
RNN-SCALED	80.2%	19.8% VAE – PEAK
RNN-SCALED	80.4%	19.6% RNN
т () 25 50 75	100
Average preference (%)		

6. Pairwise preference Q: "Choose which clip has more varied intonation"

7. MOS Q: "Rate the naturalness of each clip"

Listening tests

We evaluate naturalness and variedness, allowing us to compare the trade-off between these factors

We predict F0 and use parameters from natural speech for synthesis

Subjective and objective F0 variation do not directly correspond, therefore VAE-TAIL and RNN-SCALED were calibrated by ear to match the level of variation in COPY-SYNTH

5. Subjective vs. objective intonation variation

9. Naturalness–Variedness tradeoff

VAE–TAIL has same naturalness as other TTS voices, but is much more varied
